

MULTIPLEX CELL LINES – Calcium and β -Arrestin

MPXNOMAD HISTAMINE RECEPTOR H1

MPXNomad-HRH1 (U2OS cell line)

Ec₅₀ β -Arrestin1 assay: 3.86×10^{-8} M

Ec₅₀ calcium assay: 6.93×10^{-8} M

Z' β -Arrestin1: 0.83+/- 0.01

Z' Calcium: 0.55+/- 0.01

Product Name: HRH1_{MPX}Nomad cell line

Reference: P70735

Recp. Official Full Name: Histamine Receptor H1

DNA Accession Number: AY136743

Host Cell: U2OS

Resistance: G418 + Puromycin + Hygromycin

Quantity: > 3 x 10⁶ cells / vial

Storage: Liquid Nitrogen

Assay Briefly description

Each vial of _{MPX}Nomad-HRH1 contains U2OS cells stably expressing red β -Arrestin_{Nomad} and green Ca^{2+} _{Nomad} biosensor and Histamine receptor H1(with no tag).

Innoprot's _{MPX}Nomad-HRH1 cell line has been designed to assay compounds or analyze their capability to modulate Histamine receptor H1. When an agonist binds to HRH1 a G protein is activated, which in turn, triggers a cellular response mediated by calcium and a subsequent internalization mediated by β -Arrestin.

This cell line has been validated measuring calcium signalling and β -Arrestin mobilization analyzing Nomad biosensors distribution within the cell.

This highly reproducible assay has been validated using Histamine as agonist in a High Content Analysis (HCA) and a High Throughput Analysis (HTA).

About Nomad Biosensor Family

Nomad Biosensor family is based in a fluorescent polypeptide that measure fluctuations in the calcium and Arrestin signalling pathways changing its localization and fluorescent intensity emission within the cell.

Before the stimulation mediated by the agonist of interest, the fluorescent biosensor is localized in the cellular membrane. An increase in the second messenger concentration leads to a change in the structural folding of Nomad Biosensor that promotes its cellular relocation in the vesicular trafficking of the cells and an increase in the fluorescence.

In a cell line co-expressing _{MPX}Nomad Biosensor and a GPCR, the activity can be easily quantified on living cells by image analysis or fluorescence emission in a microplate reader.

β -Arrestin and Calcium Assay

β -arrestin- Ca^{2+} MPXNomad U2OS cells, stably expressing Histamine receptor H1 (HRH1), were stimulated with 8 log dilution series ranging from 0 to 10 μM of Histamine during 24h (n=5). % Activity was calculated relative to positive (10 μM).

Image analysis

Fig1. β -arrestin- Ca^{2+} MPXNomad biosensor stimulated with 10 μM of Histamine.

Biosensor change of localization processes were detected and analyzed using “BD Pathway 855” High-Content Bioimager from BD Biosciences. The EC_{50} after a treatment of 24 h with the agonist for β -arrestin assay was $\sim 6.93 \times 10^{-7} \text{M}$ validated with an average of $Z' = 0.55 \pm 0.02$ and for calcium assay the EC_{50} was $\sim 3.86 \times 10^{-8} \text{M}$ and $Z' = 0.83$

Fluorescence intensity analysis

Fig3. β -arrestin- Ca^{2+} MPXNomad biosensor stimulated with 10 μM of Histamine.

The increase in the fluorescence was detected and analyzed using “Synergy 2” microplate reader from Biotek. The EC_{50} after a treatment of 24 h with the agonist for β -arrestin assay was $\sim 1.03 \times 10^{-6} \text{M}$ validated with an average of $Z' = 0.59 \pm 0.02$ and for calcium assay the EC_{50} was $\sim 2.90 \times 10^{-8} \text{M}$ and $Z' = 0.87$
