

LINTERNA™ CELL LINES

GREEN FLUORESCENT HT-29 CELLS

Product Name:	LINTERNA™ - HT29 Cell line
Catalog Number:	P20123
Cell Line:	HT-29
Fluorescent Protein:	turboGFP
Resistance:	G418
Format:	>3x10 ⁶ cells in Cryopreserved vials
Storage:	Liquid Nitrogen

A novel green fluorescent HT-29 cell line has been developed through stable transfection with turboGFP protein. This cell line expresses green fluorescent protein as a free cytoplasmatic protein.

LINTERNA HT-29 cell line is stably-transfected and it is ready to use in cell-based assay applications. This stably transfected cell line provides consistent levels of expression, which helps to simplify the interpretation of the results. This cell line is intended to be used as an "in vitro" model for research studies.

About HT-29 Cell line

HT29 human cell line is a epithelial-like cell lines, which was established from a colorectal adenocarcinoma of a 44 year-old Caucasian female patient.

HT29 cell line is used to develop xenograft tumor models for colorectal cancer in nude mice, they form well differentiated adenocarcinoma consistent with colonic primary (grade I). HT29 offers a favorable experimental system for the study of factors involved in differentiation of epithelial cells. This cell line is also used as an in-vitro model to study absorption, transport, and secretion by intestinal cells.

Use Restriction This product contains a proprietary nucleic acid coding for a proprietary fluorescent protein intended to be used for research purposes only. No rights are conveyed to modify or clone the gene encoding fluorescent protein contained in this product, or to use the gene or protein other than for non-commercial research, including use for validation or screening compounds. For information on commercial licensing, contact Licensing Department, Evrogen JSC, email: license@evrogen.com

 **About turboGFP protein**

tGFP is an improved variant of the green fluorescent protein CopGFP cloned from copepoda *Pontellina plumata* (Arthropoda; Crustacea; Maxillopoda; Copepoda). It possesses bright green fluorescence (excitation/emission max = 482/ 502 nm) that is visible earlier than fluorescence of other green fluorescent proteins. TurboGFP is mainly intended for applications where fast appearance of bright fluorescence is crucial. It is specially recommended for cell and organelle labeling and tracking the promoter activity.

 **Quality Control**

All cells are performance assayed and test negative for mycoplasma, bacteria, yeast and fungi. Cell viability, morphology and proliferative capacity are measured after recovery from cryopreservation. Innoprot guarantees stable expression for many generations and provides support for cell culture and visualization.

THIS PRODUCT IS FOR RESEARCH PURPOSES

ONLY. It is not to be used for drug or diagnostic purposes, nor is it intended for human use. Innoprot products may not be resold, modified for resale, or used to manufacture commercial products without written approval of Innovative Technologies in Biological Systems, S.L.
